Appendix A 1 2 **Explanations and Examples of construct of the ORM Grammar** 3 4 <REMARK-SPEC> ::= REM [<any remarks>] 5 Explanation: Any line starting with REM is considered a remark 6 7 (comment) line and it is ignored. Example: REM This is a comment 8 9 10 <ORM-INFO> ::= [;ORMId=<ORMId>] [;ORMFile=<fileName>] 11 Explanation: <ORMId> specifies the Object Relational Mapping id of a specification. The default <ORMId> is the ا الله الله string "defaultORMId". The Object-Relational ¤ 14 Mapping information (metadata) stored in the database 15 15 .corresponding to the given <ORMId> is used for ا 16 ورا subsequent processing. (3 17 An ORMFile specification overrides the mapping 18 information corresponding to <ORMId>. This is an easy way to experiment with different mappings before 19 storing that information permanently in the database. 20 **Example:** See <DATABASE-URL> below. 21 22 23 <DATABASE-URL> ::= <reqularURL>[<ORM-INFO>]

| 1                              | Explanation: <database-url> consists of the url (uniform resource</database-url>      |
|--------------------------------|---|
| 2                              | locator, which includes database name, user name and                                  |
| 3                              | password among other things) of the database to be                                    |
| 4                              | connected to, optionally followed by ORM specific                                     |
| 5                              | information <orm_info>. <orm_info> is used to</orm_info></orm_info>                   |
| 6                              | initialize the database with the Object-Relational                                    |
| 7                              | Mapping information or to retrieve the Object-  |
| 8                              | Relational Mapping information from the database.                                     |
| 9                              | <pre>Example: See <database-spec> below.</database-spec></pre>                        |
| ()<br>:[]10<br>:[]             |   |
| 11 12                          |   |
| بر <sub>ي</sub> 12<br>در يا 12 | <pre><enddatabase-spec> ::= ;</enddatabase-spec></pre>                                |
| 13<br>13                       | <b>Explanation:</b> This is just a delimiter to signify the end of                    |
| ₩ 14<br>                       | <database-spec></database-spec>   |
| 15                             |   |
| ()]<br>16                      | <pre><database-spec> ::= DATABASE <database-url></database-url></database-spec></pre> |
| 17                             | <enddatabase-spec></enddatabase-spec>   |
| 18                             | <b>Explanation:</b> A <database-spec> specifies the database and the</database-spec>  |
| 19                             | Object-Relational Mapping (metadata) information to                                   |
| . 20                           | be used. Please see <database-url> above for more</database-url>                      |
| 21                             | details.  |
| 22                             | <pre>Example: DATABASE jdbc:odbc:sqlpubs; user=guest; password=hello;</pre>           |
| 23                             | ORMId=pubs01;   |

```
1
      or
  2
              DATABASE jdbc:odbc:sqlpubs; user=guest; password=hello;
                  ORMFile=pubs.jdx;
  3
                     The first example specifies the use of Object-
  4
  5
                Relational Mapping information stored in the database
                corresponding to the ORMId "pubs01"
  6
                     The second example specifies that the Object-
  7
  8
                Relational Mapping information should be retrieved from
  9
                the file pubs.

 21
     <REFERENCE-KEY-SPEC> ::= REFERENCE KEY <referenceKeyName>
 22
                               {<attribName> .
```

| 1        | Explanation   | A <reference-key-spec> identifies the attribute</reference-key-spec>    |
|----------|---|---|
| 2        |   | names whose combined values uniquely identify a                         |
| 3        |   | particular object. This may be an alternate way of                      |
| 4        |   | identifying objects of a particular class.                              |
| 5        |   | <reference-key-spec> is not allowed for collection</reference-key-spec> |
| 6        |   | classes.  |
| 7        | Example:  | REFERENCE_KEY name fname minit lname                                    |
| 8        |   | Here we are defining a reference key "name" consisting                  |
| 9        |   | of three attributes - fname, minit and lname.                           |
| 10       |   |   |
| 11       | <sqlmap-spe< td=""><td>CC&gt; ::= SQLMAP FOR <attribname></attribname></td></sqlmap-spe<> | CC> ::= SQLMAP FOR <attribname></attribname>                            |
| 11       |   | [COLUMN_NAME <columnname>]</columnname>                                 |
| : 13     |   | [SQLTYPE <sqltype>]</sqltype>   |
| 14<br>14 |   | [NULLABLE]  |
| 15<br>15 | Explanation   | : Through <sqlmap-spec>, one can refine the mapping of</sqlmap-spec>    |
| 16       |   | a class attribute to SQL column in one of the                           |
| 17       |   | following ways - use a column name different than the                   |
| 18       |   | attribute name, use an SQL data type different than                     |
| 19       |   | the default SQL data type for the attribute type,                       |
| 20       |   | allow the column to be nullable. Allowing mapping                       |
| 21       |   | of an attribute name to a different column name may                     |
| 22       | ·   | be handy if the existing column name is cryptic and                     |
| 23       |   | we want a more meaningful attribute name at the class                   |

| · 1            |   | definition level. Semantic knowledge of the data                                  |
|----------------|---|---|
| 2              |   | may be used to improve the storage efficiency for an                              |
| 3              |   | attribute by specifying a more refined SQL type.                                  |
| 4              |   | For example, a String attribute (zipCode) may be                                  |
| 5              |   | mapped to varchar(10) instead of default  |
| 6              |   | varchar(255).   |
| 7              |   | Some object-oriented languages like Java  |
| 8              |   | provide facility of reflection whereby the attribute                              |
| 9              |   | names for a class and their types may be determined                               |
| ]<br>]10       |   | programmatically. If that is not the case, then a                                 |
| 11             |   | <sqlmap-spec> needs to be specified for each</sqlmap-spec>                        |
| 12             |   | attribute. Otherwise, some default mapping may be                                 |
| []<br>13       |   | done using reflection facility.   |
| 14<br>14       | Example:  | SQLMAP FOR prInfo COLUMN_NAME pr_info SQLTYPE text                                |
| <u>j</u><br>15 | or  |   |
| 16             |   | SQLMAP FOR zip SQLTYPE varchar(10)  |
| 17             |   |   |

|  | 22     |  |
|  | 23     |  |

EMBEDDED keyword means that the value of a complex attribute is embedded in a large binary column of the same table where rest of the primitive attributes are stored. This may be an optimized way for storing a referenced object if that referenced object does not need to be retrieved in any other context.

A Non-embedded complex attribute references a regular class or a collection class identified by <targetClassName>.

BYVALUE keyword implies that the referenced object (may be a collection object) does not have an independent existence without the existence of the containing object. When a containing object is stored, all the objects referenced through its BYVALUE complex attributes are also stored in the database. If a containing object is deleted, its BYVALUE referenced objects should also be deleted. <referenceKeyName> specifies the name of a reference key of the class <targetClassName>. By default, referencing is done to the PrimaryKey of the target class.

The list of <attribName> is an ordered enumeration of the source attributes in the current class which are

| 1  |          | used to find the target class objects through the      |
|--|----------|--|
| 2  |          | reference key. The data types of the source            |
| 3  |          | attributes should be compatible with the data types    |
| 4  |          | of the attributes defining the reference key in the    |
| 5  |          | target class.  |
| 6  | Example: | RELATIONSHIP titles REFERENCES ArrayTitle BYVALUE WITH |
| 7  |          | pub_id   |
| 8  | or       |  |
| 9  |          | RELATIONSHIP job REFERENCES Job REFERENCED_KEY         |
| []<br>   10<br>   1                          |          | PrimaryKey WITH job_id                                 |
| 10 mg 11 11 11 11 11 11 11 11 11 11 11 11 11 |          | The first specification means that the complex         |
| `  |          | attribute 'titles' references an object of type        |
| 13<br>13                                     |          | ArrayTitle (which is a collection (array) of Title     |
| 11/2<br>11/2<br>11/2<br>11/4                 |          | objects). The referenced object is contained in the    |
| 15   |          | current object by value. The attribute pub_id of       |
| 16<br>16                                     |          | the containing class is used to identify the (default  |
| 17   |          | primary key of the) referencing object.                |
| 18   |          | The second example specifies that the complex          |
| 19   |          | attribute 'job' references an object of class 'Job'    |
| 20   |          | with the referencing object's attribute 'job_id' which |
| 21   |          | should match the primary key attribute of the class    |
| 22   | ·        | `Job'.   |

```

  2
      <ENDCLASS-SPEC> ::= ;
      Explanation: This is just a delimiter to signify the end of a
  3
  4
                  <CLASS-SPEC> or a <COLLECTION-CLASS-SPEC>.
  5
      <CLASS-SPEC> ::= CLASS<className>[TABLE<tableName>]<PRIMARY-KEY-SPEC>
  6
  7
                           [<REFERENCE-KEY-SPEC> . . .
  8
                           [<SQLMAP> . . . ]
                           [<RELATIONSHIP-SPEC> . .
13
13
10
                          <ENDCLASS-SPEC>
11
      Explanation: A <CLASS-SPEC> encapsulates all the Object-
ا
دي 12
                  Relational Mapping information about one class.
T. I
                  The <tableName> specifies the name of the relational
si 13
14
                  table which holds the instances of this class.
                                                                      The
15
15
                  default <tableName> is the same as the <className>.
16
                  Other specifications have been explained earlier.
 17
                  Please note that it is mandatory to specify <PRIMARY-
                  KEY-SPEC> for a class.
  18
      Example:
                  CLASS Title TABLE titles
 19
  20
                  PRIMARY_KEY title_id
                  RELATIONSHIP royscheds REFERENCES ArrayRoySched
  21
  22
                  BYVALUE WITH
```

```
title id
  1
                  SQLMAP FOR price SQLTYPE Money
  2
  3
  4
     <ORDERBY-SPEC> ::= ORDERBY {<attribName> . . . }
  5
     Explanation: An <ORDERBY-SPEC> of a <COLLECTION-CLASS-SPEC>
  6
  7
                  specifies an ordered list of attributes whose values
                 are used to sequence the objects in a collection
  8
  9
                 during retrieval.
ORDERBY ytd sales title id
     Example:
                 The above specification for the collection class
12
13
13
                 ArrayTitle means that such a collection of objects (e.
                        in the titles attribute of a Publisher class
                 q.
14
                 object) should be ordered as per the values of
                 ytd sales and title id attributes of the Title objects
                 in the collection.
 16
 17
     <COLLECTION-CLASS-SPEC> ::= COLLECTION CLASS <className>
 18
     COLLECTION TYPE {ARRAY | VECTOR}
 19
 20
          ELEMENT CLASS <elementClassName>
                               [ELEMENT TABLE <elementTableName>]
 21
 22
                               <PRIMARY-KEY-SPEC>
```

| 1                                      | [ <orderbi-spec>]</orderbi-spec>  |
